

Apollo Blasting Helmet

The Apollo 60 Blast Helmet is utilised to protect blasting operators from health hazards associated with abrasive blasting. The helmet provides protection to the head and neck areas from flying and ricocheting abrasives; excessive noise levels generated by the blast nozzle, and dust generated from the pulverized coating and shattered abrasive. The helmet is manufactured from a 2 piece polycarbonate shell, shaped to permit an even dispersion of the incoming breathing air supply around all areas of the head, face and neck, providing maximum operator comfort. The internal shell is built to hard hat protection standards and is fitted with an adjustable head harness and chinstrap.

Breathing air is supplied to the helmet via a sound absorbing hose fitted to the rear of the helmet. The interior of the helmet is lined with sound absorption material to reduce noise levels generated during blasting.

A nylon cape, attached to the base of the helmet, provides protection to the chest and waist area from rebounding abrasives. The cape is fitted with an internal elasticated, perforated neck band that seals against the operators neck, permitting air to exit the helmet whilst preventing the egress of dust into the helmet.

A double layer viewing window protects operators from rebounding abrasive. The inner lense provides protection, whilst expendable outer lenses prevent the inner lense from frosting and requiring frequent replacement. The exterior lenses maybe loaded 5 at a time into the window frame and torn off as and when frosted. This feature ensures blasting does not have to be frequently stopped for lense changing.

The Apollo 60 must be used either with an Air Control Valve, Cool Air Tube or Climate Control Tube. Air supplied to the helmet must be 25-34m³/hr (15-20cfm) @ 585-655kpa (85-95psi). The air supply must meet the minimum quality standard as specified by the prevailing authority.
